

When health and hygiene is key, the inevitable refurbishment of PHEs is essential. But you will want to reduce downtime, while ensuring long-term reliability and hence productivity.

That's where Plough Engineering refurbishment services come in. Our comprehensive processes are thoroughly documented and certified to the highest standards. The plates we receive are fully cleaned and degasketed by chemical immersion and pressure washing. Cleaned plates go through dye penetrant testing then close examination to reveal the minutest defect or corrosion. The plates that are passed are then regasketed - and both the plates and gaskets are inspected, then palletised in pack order, before despatch for rapid installation. That way, you can rest assured that you've had the most professional PHE exchanger service.

REFURBISHING

- Full plate cleaning and degasketting
- Dye penetration testing
- Full inspection
- Gasketting
- Hands-on, on-site services
- Loan pack services minimise downtime
